Waves

Structure and Function

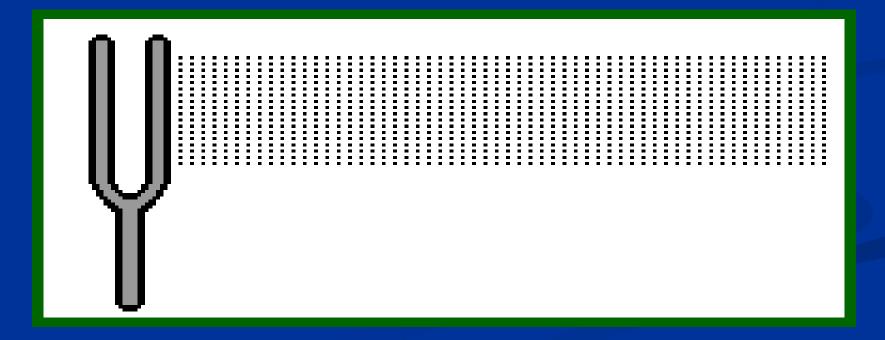

What is a Wave?

- A <u>wave</u> is a disturbance that moves <u>energy</u> through <u>matter</u> or space.
- Waves do NOT move matter; they move energy.

How are Waves Made?

- All waves are <u>created</u> by <u>vibrations</u>.
- Earthquakes <u>send</u> out waves due to the <u>Earth</u> vibrating.
- You are <u>able</u> to <u>speak</u> because your <u>vocal</u> cords vibrate.

Mechanical Waves

- 1. Mechanical Waves A wave that can only travel through a medium.
 - Medium <u>Matter</u> that a wave <u>travels</u> through.

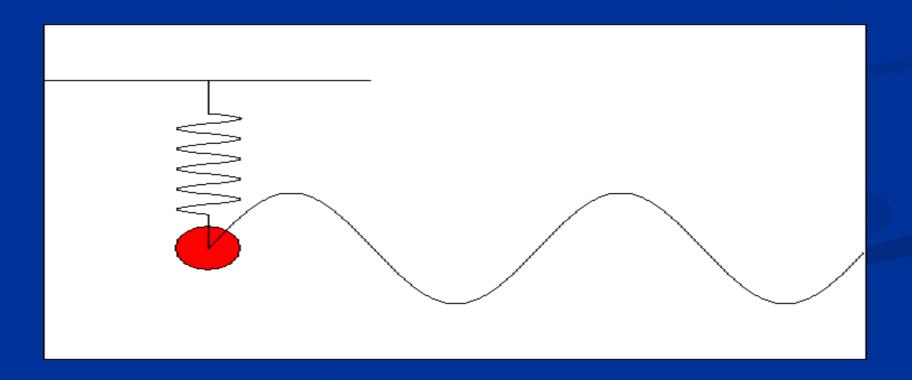

Types of Mechanical Waves

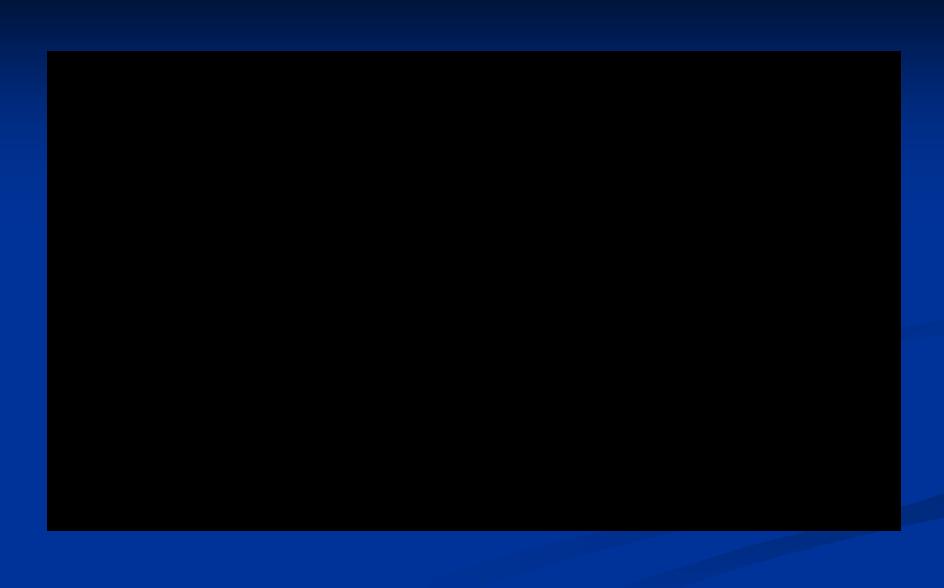

- 1. Transverse Waves
- 2. Longitudinal or Compressional Waves

Transverse Waves

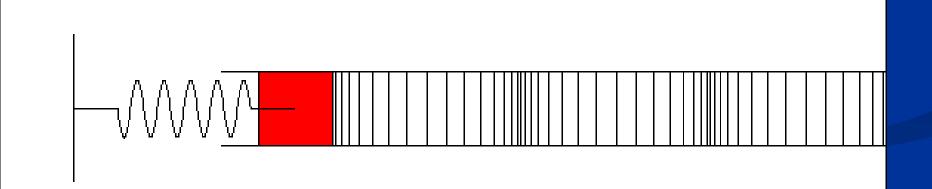

- A <u>wave</u> in which <u>matter</u> moves at a <u>right</u> angle to the direction the <u>energy</u> is <u>traveling</u>.
- Examples
 - 1. Light
 - 2. <u>Earthquake</u>

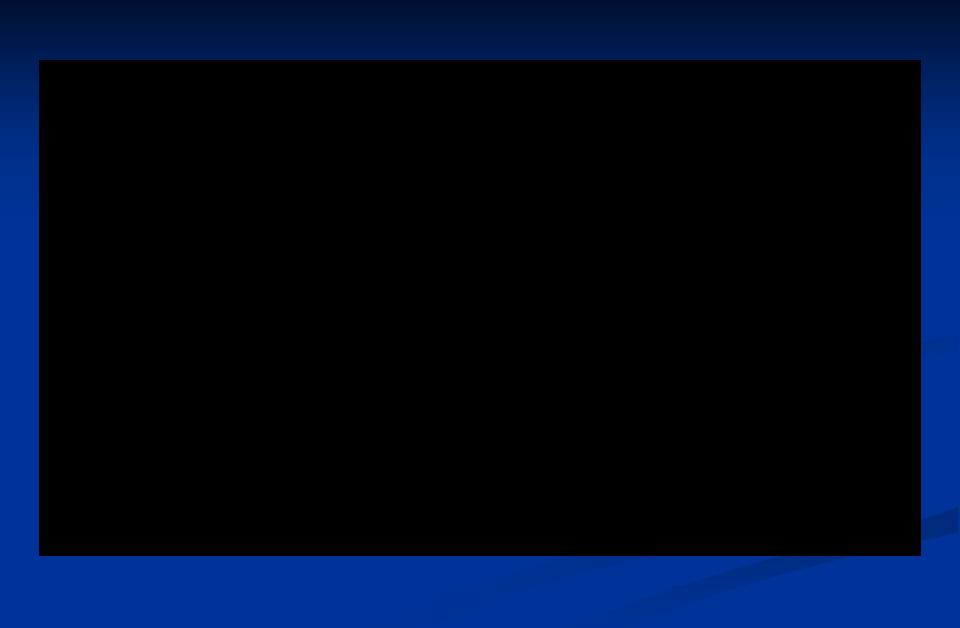

Longitudinal or Compressional Waves

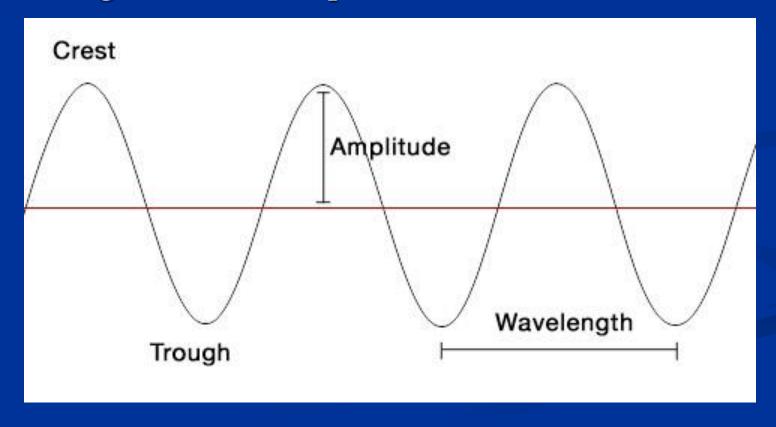

- A <u>wave</u> in which the matter moves <u>parallel</u> to the <u>direction</u> the energy in the <u>wave</u> travels.
- Sound is a longitudinal wave.
- When the matter is spaced out it is called rarification.
- When the matter bunches up it is called compression.

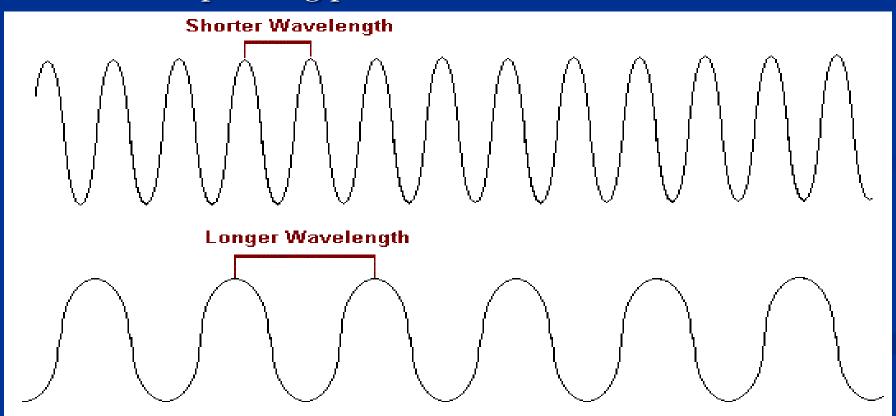

Parts of a Wave

- 1. <u>Crest</u> the <u>highest</u> point of a wave.
- 2. Trough the <u>lowest</u> point of a <u>wave</u>.

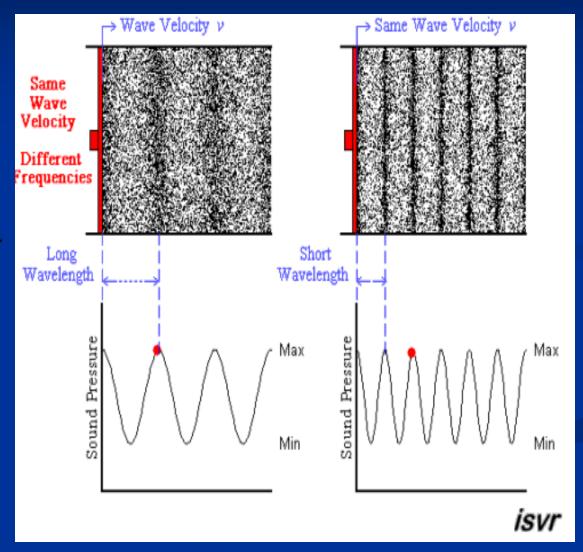

Parts of a Wave

3. <u>Wavelength</u> – The <u>distance</u> from one <u>point</u> on a <u>wave</u> to the <u>corresponding</u> point on the <u>next</u> wave.

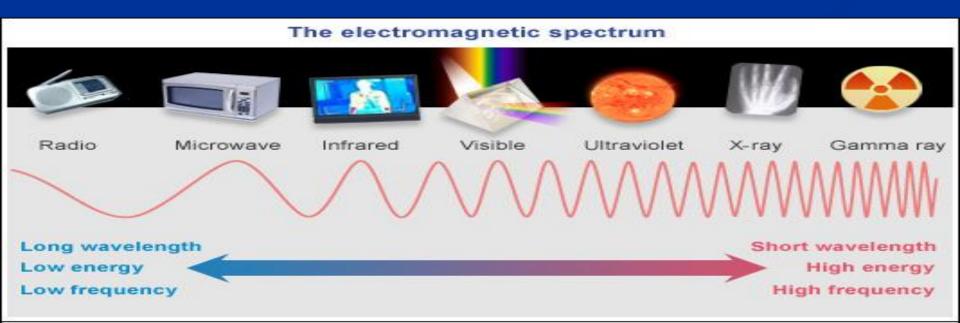

Wavelength & Frequency

- Frequency –The number of wavelengths that pass a certain point each second.
- Inherefore, the higher the frequency the shorter the wavelength.

Wavelength and Energy

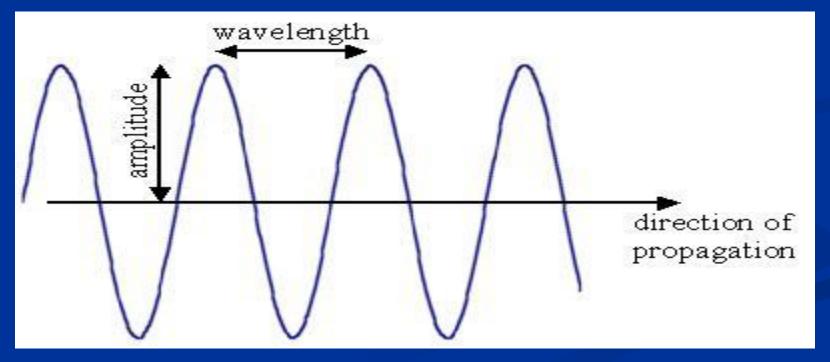

- The <u>shorter</u> the wavelength the <u>higher</u> the energy
- The <u>longer</u> the wavelength the <u>lower</u> the energy

The radiation behind radios, visible light and nuclear blasts is all exactly the same thing, just with different amounts of energy.

Parts of a Wave

- 4. Amplitude The <u>amount</u> of energy in a wave.
 - More energy means a higher amplitude.
 - The distance from the <u>crest</u> or trough to the <u>midline</u> of the wave.

Amplitude & Energy

The greater the amplitude, the greater the amount of energy.
